v. 132, no. 6, p. 1299-1302.

A study was made of the first stages of the photocon-
ductivity relaxation of high-vacuum-sublimated layers
(from 0.1 μ to several microns thick) of metal-free
and Cu- and Mg-containing phthalocyanin deposited on
quartz or mica surfaces with Pt or Au electrodes.
The taumeter method of N. A. Tolstoy et al. (Uspekhi
Fiz. Nauk 41: 44, 1950) permitted the simultaneous
observance on a CRO of the entire process of growth
and fall-off of the photocurrent. In most cases the
growth curves were unsymmetrical and nonexponen-
tial. Fall-off follows the hyperbolic law, which sug-
gests the bimolecular process of recombination. A

dependence of relaxation on the intensiveness of illumination in the presence of oxygen was apparently caused by the localization of electrons at adhesion levels which increased the length of recombination processes.
